

Amendments to the claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of claims:

1. (Currently amended) A computer implemented method comprising:
generating a list of one or more identifiers for one or more broadcast domains;
accepting a segment of data from a host system, a portion of the segment identifying a
particular broadcast domain of the one or more broadcast domains;
comparing the portion of the segment of data identifying the particular broadcast domain
with the list an identifier for a selected broadcast domain; and
excluding the segment of data from transmission from the host system based on the
comparison between the portion of the segment and the list identifier for the selected broadcast
domain.
2. (Original) The method of claim 1 wherein the host system comprises a computer
system having a protocol stack configured to generate data packets.
3. (Original) The method of claim 2 wherein the segment of data comprises a frame
including one of the data packets.
4. (Original) The method of claim 3 wherein the portion comprises a VLAN ID.
5. (Original) The method of claim 4 wherein the VLAN ID is configured according to an
IEEE 802.1Q VLAN protocol.

6. (Original) The method of claim 4 further comprising generating the VLAN ID based on a network address.

7. (Previously presented) The method of claim 1 wherein the segment is excluded ~~from~~ transmission from the host system if the portion corresponds to the identifier.

8. (Previously presented) The method of claim 1 wherein the segment is excluded from transmission from the host system if the portion does not correspond to the identifier.

9. (Previously presented) The method of claim 1 wherein the excluding comprises blocking the segment from being transmitted from the host system.

10. (Previously presented) The method of claim 1 wherein the excluding comprises intentionally corrupting the segment so that the segment is discarded from traffic received over a network connection.

11. (Original) The method of claim 1 wherein the identifier is inaccessible by the host system.

12. (Original) The method of claim 1 wherein the identifier is inaccessible by the host system after a boot phase.

13. (Original) The method of claim 1 wherein the segment is accepted from the host system over a data bus.

14. (Original) The method of claim 2 further comprising:
accepting a second segment of data from a physical layer network interface, a portion of the second segment identifying a broadcast domain;

comparing the portion of the second segment with an identifier for a broadcast domain associated with the host system; and

sending the second segment to the host system if the portion of the second segment corresponds to the identifier for the broadcast domain associated with the host system.

15. (Original) The method of claim 14 wherein the identifier for the broadcast domain associated with the host system is inaccessible by the host system.

16. (Original) The method of claim 14 wherein the identifier for the broadcast domain associated with the host system is inaccessible by the host system after a boot phase.

17. (Currently amended) An apparatus comprising:

an interface to establish a network connection;

a network controller configured to

generate a list of one or more identifiers for one or more broadcast domains;

accept a segment of data from a host system, a portion of the segment identifying a particular broadcast domain of the one or more broadcast domains;

compare the portion of the segment of data identifying the particular broadcast domain with the list an identifier for a selected broadcast domain; and

exclude the segment of data from transmission from the host system based on the comparison between the portion of the segment and the list identifier for the selected broadcast domain.

18. (Original) The apparatus of claim 17 wherein the host system comprises a computer system having a protocol stack configured to generate data packets.

19. (Original) The apparatus of claim 18 wherein the segment of data comprises a frame including one of the data packets.

20. (Original) The apparatus of claim 19 wherein the portion comprises a VLAN ID.

21. (Previously presented) The apparatus of claim 17 wherein the segment is excluded from transmission from the host system if the portion corresponds to the identifier.

22. (Previously presented) The apparatus of claim 17 wherein the segment is excluded from transmission from the host system if the portion does not correspond to the identifier.

23. (Previously presented) The apparatus of claim 17 wherein the excluding comprises blocking the segment from being transmitted from the host system.

24. (Previously presented) The apparatus of claim 17 wherein the excluding comprises intentionally corrupting the segment so that the segment is discarded from traffic received over a network connection.

25. (Original) The apparatus of claim 17 wherein the identifier is inaccessible by the host system.

26. (Original) The apparatus of claim 17 wherein the identifier is inaccessible by the host system after a boot phase.

27. (Currently amended) A system comprising:
a host system;
an interface to establish a network connection between a network and the host system;
and
a network controller configured to
generate a list of one or more identifiers for one or more broadcast domains;

accept a segment of data from the host system, a portion of the segment identifying a particular broadcast domain ~~of the one or more broadcast domains;~~
compare the portion of the segment of data identifying the particular broadcast domain with the list ~~an identifier for a selected broadcast domain;~~ and
exclude the segment of data from transmission from the host system based on the comparison between the portion of the segment and the list ~~identifier for the selected broadcast domain.~~

28. (Original) The system of claim 27 further comprising a management system having a protocol stack configured to generate management packets.

29. (Original) The system of claim 27 wherein the host system comprises a computer system having a protocol stack configured to generate data packets.

30. (Original) The system of claim 28 wherein the segment of data comprises a frame including one of the data packets.

31. (Original) The system of claim 29 wherein the portion comprises a VLAN ID.

32. (Previously presented) The system of claim 27 wherein the segment is excluded from the host system if the portion corresponds to the identifier.

33. (Previously presented) The system of claim 27 wherein the segment is excluded from the host system if the portion does not correspond to the identifier.

34. (Previously presented) The system of claim 27 wherein the excluding comprises blocking the segment from being transmitted from the host system.

35. (Previously presented) The system of claim 27 wherein the excluding comprises intentionally corrupting the segment so that the segment is discarded from traffic received over a network connection.

36. (Original) The system of claim 27 wherein the identifier is inaccessible by the host system.

37. (Original) The system of claim 27 wherein the identifier is inaccessible by the host system after a boot phase.

38. (Currently amended) A system comprising:
a router;
a host system;
an interface to establish a network connection between the router and the host system;
and
a network controller configured to
generate a list of one or more identifiers for one or more broadcast domains;
accept a segment of data from the host system, a portion of the segment
identifying a particular broadcast domain of the one or more broadcast domains;
compare the portion of the segment of data identifying the particular broadcast
domain with the list an identifier for a selected broadcast domain; and
exclude the segment of data from transmission from the host system based on the
comparison between the portion of the segment and the list identifier for the selected
broadcast domain.

39. (Original) The system of claim 38 wherein the portion comprises a VLAN ID.
